What did you enjoy the most and least about the exercise?

I enjoyed Working with the Twitter API and using Tweepy for searching and extracting tweets. I also enjoyed reading research papers in misinformation and different methodologies used to investigate, monitor and visualize the creation and consumption of this information.

What did you find most challenging
It was very difficult finding a dataset to build a predictive model to find out who would win a penalty shootout between Ronaldo and Zidane. I found several datasets, but none was comprehensive enough to have the following variables needed for the model:

Age of the player
How many years in the game
How many penanlties scored
How many penalties missed
Player position
Foot used

With this data, a logistic regression model using sklearn would have been the model to predict who would win a penalty shoot out.

What was your overall experience

This was a very enlightening and immersive experience. A lot has been done and a lot of learning has happened as well. A very fun filled three days.
